Cpts 317. 8/22

1. Keep your self busy.

2. cell: 509 338 5089.

3. Textbook: Buy it if you want.

4. Mid, final —— in class, closed book/notes

Mid: Oct 7, in class

Final: Dec 13, 4:30 — 6:30pm, in class room.

5. hw — one per week.

Do hw.

6. Grading: hw — 30%

mid — 30%

final — 40%.

7. hard to get A.

8. office hours: T, T, 2–3pm

also ZOOM (info on syllabus).

Sunday noon — 2pm. ZOOM.

9. Don't fail in the 1st month.

Title:

Automata & Formal Languages.

||

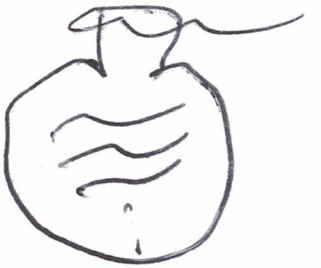
anything that is moving or not moving.

||

a set of strings.

Example:

cat



behavior = a seq of events

= a string.

Exaple:

is a good student with behavior:

$$\underbrace{\text{walk, sleep, walk, sleep, } \ldots}_{\text{a string!}}$$

a bad student's behavior:

sleep, game, sleep, game, ...

Summary: Cpt 317 talks about

Automaton	language
Cat	Cat's behaviors
program	program's behaviors.
⋮	⋮

you are what you read,

do.

a set of behaviors = semantics.

Def: event a = "show red flower"

event b = "show blue flower"

Consider a language $\mathcal{L}$ where all strings are in the following format:

$$\underbrace{a \cdots a}_{0 \text{ or more}} b$$

Write a program P that has exactly (not any more, nothing less) the observable behaviors defined in $\mathcal{L}$.

Note: By convention, a program's observable behavior is one when it exits nicely;

---

my program:

```
while at each second {
    if house collapses break;
    show red flower;
}
show blue flower;
exit nicely.
```

use interrupt.
